

Case Study – Adam House

Adam House was built in 1774 by Robert Adam as part of the Adelphi Development, the first coherent property development in London. Adam House comprises four adjoining houses in Adam Street, The Strand. The façade of No. 7 Adam Street is one of the last and most important remaining features of these terraces and the Anthemion pattern that first appeared in its pilasters, became a recurring motif in the Georgian architecture that stemmed from the period.

In 2000 Adam House was refurbished to provide the highest standard of office space in the area. By providing a high technology infrastructure, run by staff that are committed to serving their clients needs, Adam House provides a flexible property solution that is in step with the fast moving economy of the 21st Century.

The refurbishment included Cat 5 voice and data cabling in all rooms so IT and telephone systems can be installed, changed and removed to meet the constantly changing requirements of clients.

Adam House have a SDX Index system supporting 150 users. An Elephant call logging system is installed so that calls can be evidenced and clients billed accurately.

Because Adam House is a serviced office complex, the telephone system are constantly being changed and upgraded to meet the evolving needs of existing clients as well as the needs of new clients. This has placed a high demand on the supplier, Working Telecoms Ltd.

“Working Telecoms have the highest level of expertise in the industry, they are quick and efficient and respond to problems with a friendly and helpful manner. The ‘Retainer’ contract meets our needs exactly and has reduced our maintenance costs by 75%”.

James Minter
Managing Director, Adam House
